

Let us find use for your used Moore fan blades

This wind turbine is an Alberta innovation that was originally invented and patented to power remote oilfield installations. Now there is interest for domestic purposes, such as, cabins and cottages. The Moore fan blades are recycled to produce renewable, “green” energy. The wind speed to generate full power is only 13KPH.

Motion Canada is proud to help this small energy start-up by spreading the word and trying to find used Moore fan blades that would otherwise be discarded.

In the interest of cost savings, we are not asking to broker any deals but we will help as much as we can to line up this transaction.

Renew/Reuse/Recycle
